

Notes meeting Visual Storytelling for Big Imaging data. 07-11-2017

Present: Jiri, Lorenzo, Yun, Frans, Pjotr, Maarten, Tom, Jos

Not present: Adrienne, Peter

Submission to the PacificVIS conference contest needs to be done 19th of January.

Data:

Ask Peter to get us some (nice) data.

Exploration:

WebGL rendering of hospital data (volume rendering, intersection with surface objects. (Yun, Pjotr and Lorenzo)

Interface between WebGL interaction and the Phovea CLUE software to record provenance steps (button to record matrix values etc.). (Maarten and Tom)

Adding / removing labels etc. These should end up in the provenance graph. (Maarten and Tom)

Authoring:

Store objects or volumes (simply) selected by the user to annotate in the provenance graph. (Yun)

Redesign the provenance graph +git merge ideas etc. (Lorenzo)

- Collapsible 3d movement interactions.

Make annotations in the 3D space and move them, if we click on an object we add the annotation to the selected object. (Maarten and Tom)

In 2D space we add captions (slides in a presentation) (Tom and Maarten).

Presentation:

3D rendering with the smooth interpolated keyframes (Pjotr, Yun, Lorenzo)

Smooth interpolation between key frames which are recorded when the user uses a menu item or presses a button. (Pjotr, Yun, Lorenzo)

Expertise:

Jiri (supervising Lorenzo) C++, OpenGL.

Pjotr: C++, OpenGL, Open SceneGraph

Yun: Human Computer Interaction, C++, OpenGL, Open SceneGraph

Maarten: Java, Javascript, Typescript, OpenGL, WebGL

Tom: Javascript, Typescript, Python, Flask

Lorenzo: Javascript, Python

Code base:

Three.js <https://threejs.org/>

Phovea CLUE <https://github.com/Caleydo/gapminder>

AngularJS: <https://angularjs.org/>

Research Ideas:

‘Git merge’ on the provenance graph, to change some parts and rewind all of the interaction steps afterwards.

Next steps:

(Yun, Pjotr, Lorenzo)

Find a WebGL library that we want to use. Do some simple implementations of WebGL interactions in a very base interface, so Tom/Maarten can develop the CLUE provenance graph elements based on that.

(Tom, Maarten)

Angularize the CLUE software and share a basic version of that so Lorenzo can start thinking of new interaction methods and representations of certain elements.
